### No-Braze O-Ring Face Seal Design

### No-Braze Assembled

No-Braze O-Ring Face Seal is a compression style nut, ferrule, and see design that works with standard O-Ring Face Seal fittings. No-Braze has all of the advantages of the standard OFS design without brazing. The components can even be reused. It can also be used with any wall thickness tubing that is specified by SAE J356, J524, J525, and J526 with a hardness not exceeding Rockwell B65. No Braze assembles in almost the same way as the standard OFS, but eliminates the hazardous steps involved with brazing. Thereby, eliminating the health risks associated with brazing on plated parts. Since there is no braze joint, there is no time spent preparing the components, or cleaning up afterwards. Likewise, the cost savings from not having to buy torches, silver braze, flux, chemicals, solvents for clean up, and all of the other related items is a great benefit. The No-Braze connection eliminates the time consuming steps of brazing. This negates any possibility of leakage due to faulty brazing. Another advantage is that there is no need for a torque wrench. It tightens by a Turns method rather than by torque values. Nut, Sleeve, and Ferrule (FS418, FS419, FS719) as below.

**FS418**  
**No-Braze Tube Nut**

Use with FS419 and FS719
